AtCoder Beginner Contest 111 –

Problem B: AtCoder Beginner

Contest 111

Kurohashi has never participated in AtCoder Beginner Contest (ABC).

The next ABC to be held is ABC N (the N-th ABC ever held). Kurohashi wants to make his debut in some ABC x such that all the digits of x in base ten are the same.

What is the earliest ABC where Kurohashi can make his debut?

Entrada e saída

Constraints

- $100 \le N \le 999$
- ullet N is an integer.

Input

Input is given from Standard Input in the following format:

N

Output

If the earliest ABC where Kurohashi can make his debut is ABC n, print n.

Exemplo de entradas e saídas

Exemplo de Entrada	Exemplo de Saída
111	111
112	222
750	777

Solução

- Há apenas 9 possibilidades para a resposta:
 111, 222, 333, 444, 555, 666, 777, 888 e 999
- A resposta será o menor dentre entes valores que é maior ou igual a ${\cal N}$
- Tal valor pode ser localizado através de uma busca linear simples
- Outra alternativa é utilizar a função lower_bound() da STL
- Em ambos casos, a complexidade da solução é constante

Solução O(1)

```
1 #include <bits/stdc++ h>
3 using namespace std;
5 int solve(int N)
6 {
     vector<int> contests;
7
8
     for (int d = 1; d \le 9; ++d)
9
          contests.push_back(100*d + 10*d + d);
10
     auto it = lower_bound(contests.begin(), contests.end(), N);
     return *it;
14
15 }
16
```

Solução O(1)

```
17 int main()
18 {
      ios::sync_with_stdio(false);
19
20
      int N;
21
      cin >> N;
22
      auto ans = solve(N);
24
25
      cout << ans << '\n';</pre>
26
27
      return 0;
28
29 }
```

UVA 10077 - The Stern-Brocot

Number System

The Stern-Brocot tree is a beautiful way for constructing the set of all nonnegative fractions $\frac{m}{n}$ where m and n are relatively prime. The idea is to start with two fractions $(\frac{0}{1},\frac{1}{0})$ and then repeat the following operations as many times as desired:

Insert
$$\frac{m+m'}{n+n'}$$
 between two adjacent fractions $\frac{m}{n}$ and $\frac{m'}{n'}.$

For example, the first step gives us one new entry between $\frac{0}{1}$ and $\frac{1}{0}$,

$$\frac{0}{1}, \frac{1}{1}, \frac{1}{0}$$

and the next gives two more:

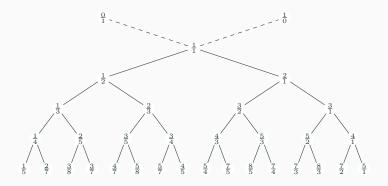

$$\frac{0}{1}, \frac{1}{2}, \frac{1}{1}, \frac{2}{1}, \frac{1}{0}$$

8

The next gives four more,

$$\frac{0}{1}, \frac{1}{3}, \frac{1}{2}, \frac{2}{3}, \frac{1}{1}, \frac{3}{2}, \frac{2}{1}, \frac{3}{1}, \frac{1}{0}$$

and then we will get 8, 16, and so on. The entire array can be regarded as an infinite binary tree structure whose top levels look like this:

The construction preserves order, and we couldn't possibly get the same fraction in two different places.

We can, in fact, regard the Stern-Brocot tree as a number system for representing rational numbers, because each positive, reduced fraction occurs exactly once. Let's use the letters 'L' and 'R' to stand for going down to the left or right branch as we proceed from the root of the tree to a particular fraction; then a string of L's and R's uniquely identifies a place in the tree. For example, LRRL means that we go left from $\frac{1}{1}$ down to $\frac{1}{2}$, then right to $\frac{2}{3}$, then right to $\frac{3}{4}$, then left to $\frac{5}{7}$. We can consider LRRL to be a representation of $\frac{5}{7}$. Every positive fraction gets represented in this way as a unique string of L's and R's.

Well, actually there's a slight problem: The fraction $\frac{1}{1}$ corresponds to the empty string, and we need a notation for that. Let's agree to call it I, because that looks something like 1 and it stands for "identity".

In this problem, given a positive rational fraction, you are expected to represent it in *Stern-Brocot number system*.

Entrada e saída

Input

The input file contains multiple test cases. Each test case consists of a line contains two positive integers m and n where m and n are relatively prime. The input terminates with a test case containing two 1's for m and n, and this case must not be processed.

Output

For each test case in the input file output a line containing the representation of the given fraction in the *Stern-Brocot number system*.

Solução '

- A árvore apresentada no exemplo e das sequências iniciais permitem a observação que a sequência é crescente
- Mais precisamente, a árvore com raiz $\frac{1}{1}$ é uma árvore binária de busca
- Isto permite o uso da busca binária para determinar, a cada elemento, se é preciso seguir à esquerda ou à direita
- A busca se encerra quando o número a ser representado é atingido
- \bullet Deste modo, a solução tem complexidade $O(N\log N)$, onde N é o número máximo de elementos da árvore até que se atinja a fração desejada

Solução $O(N \log N)$

```
#include <bits/stdc++.h>
3 using namespace std;
4 using 11 = long long;
s using ii = pair<ll, ll>;
7 const int MAX { 10000010 };
9 bool operator<(const ii& m, const ii& n)</pre>
10 {
      return m.first * n.second < m.second * n.first;</pre>
12 }
14 ll gcd(ll a, ll b)
15 {
     return b ? gcd(b, a % b) : a;
16
17 }
18
19 string stern_brocot(const ii& n)
20 {
      ii m(1, 1), L(0, 1), R(1, 0);
```

Solução $O(N \log N)$

```
22
      ostringstream os;
24
      while (m != n)
25
26
          if (n < m)
28
              os << "L";
               R = m;
30
          } else
31
32
              os << "R";
               L = m;
34
35
36
          m = ii(L.first + R.first, L.second + R.second);
38
          11 d = gcd(m.first, m.second);
39
          m.first /= d;
40
          m.second /= d;
41
42
```

Solução $O(N \log N)$

```
43
     return os.str();
44
45 }
46
47 int main()
48 {
      int p, q;
49
50
      while (cin >> p >> q)
51
52
           if (p == 1 \text{ and } q == 1)
53
               break;
54
55
           auto ans = stern_brocot(ii(p, q));
56
57
          cout << ans << '\n';
58
59
60
      return 0;
61
62 }
```
