### Codeforces Round #179

Problema A: Greg and Array

Prof. Edson Alves – UnB/FGA

#### **Problema**

Greg has an array  $a=a_1,a_2,\ldots,a_n$  and m operations. Each operation looks as:  $l_i,r_i,d_i, (1\leq l_i\leq r_i\leq n)$ . To apply operation i to the array means to increase all array elements with numbers  $l_i,l_i+1,\ldots,r_i$  by value  $d_i$ .

Greg wrote down k queries on a piece of paper. Each query has the following form:  $x_i, y_i, (1 \le x_i \le y_i \le m)$ . That means that one should apply operations with numbers  $x_i, x_i + 1, \ldots, y_i$  to the array.

Now Greg is wondering, what the array a will be after all the queries are executed. Help Greg.

1

#### Entrada e saída

#### Input

The first line contains integers  $n, m, k (1 \le n, m, k \le 10^5)$ . The second line contains n integers:  $a_1, a_2, \ldots, a_n (0 \le a_i \le 10^5)$  – the initial array.

Next m lines contain operations, the operation number i is written as three integers:  $l_i, r_i, d_i, (1 \le l_i \le r_i \le n), (0 \le d_i \le 10^5).$ 

Next k lines contain the queries, the query number i is written as two integers:  $x_i,y_i,(1\leq x_i\leq y_i\leq m).$ 

The numbers in the lines are separated by single spaces.

#### Output

On a single line print n integers  $a_1,a_2,\ldots,a_n$  – the array after executing all the queries. Separate the printed numbers by spaces.

Please, do not use the %11d specifier to read or write 64-bit integers in C++. It is preferred to use the cin, cout streams of the %164d specifier.

- A solução tem três partes
- A primeira é acumular o número de vezes que cada operação deverá ser realizada
- Isto pode ser feito com uma árvore de Fenwick com suporte para range update
- Em seguida, deve-se acumular o impacto de cada operação no vetor original
- ullet O número de vezes x que a operação i será aplicada pode ser feita com uma point query na árvore
- Novamente é necessária uma árvore de Fenwick com suporte para range update
- ullet O intervalo [L,R] deve ser atualizado com o valor dx
- ullet Por fim, a cada posição do vetor i deve ser adicionado o valor y obtido pela point query do índice i da árvore
